## Review Fundamentals of Valuation

These class notes review this material and also provide some help for a financial calculator. It also has some self-test questions and problems. Class notes are necessarily brief. See any principles of finance book for a more extensive explanation.

Eugene F. Brigham, Joel F. Houston Fundamentals of financial management HG 4026 B6693 1998
Ross, Stephen A, Westerfield, and Jordan Fundamentals of corporate finance HG 4026 .R677 1995

## PART I: Single Sum.

Time Value of Money: Know this terminology and notation

| FV | Future Value | $(1+\mathrm{i})^{\mathrm{t}}$ Future Value Interest Factor [FVIF] |
| :---: | :--- | :--- |
| PV | Present Value | $1 /(1+\mathrm{i})^{\mathrm{t}}$ Present Value Interest Factor [PVIF] |
| i | Rate per period |  |
| t | \# of time periods |  |

## Question: Why are (1+i) and (1+i) ${ }^{\mathbf{t}}$ called interest factors?

Answer: 1. Start with simple arithmetic problem on interest:
How much will $\$ 10,000$ placed in a bank account paying $5 \%$ per year be worth compounded annually?

Answer: Principal + Interest

$$
\$ 10,000+\$ 10,000 \times .05=\$ 10,500
$$

2. Factor out the $\$ \mathbf{1 0 , 0 0 0}$.

$$
10,000 \times(1.05)=\$ 10,500
$$

3. This leaves (1.05) as the factor.
4. Find the value of \$10,000 earning $5 \%$ interest per year after two years.

Start with the amount after one year and multiply by the factor for each year.

$$
\begin{array}{ll} 
& \quad \text { [Amount after one year] } \times(1.05) \\
= & {[\$ 10,000 \times(1.05)] \times(1.05)} \\
= & \$ 10,000 \times(1.05)^{2} \\
= & \$ 11,025 .
\end{array}
$$

$$
\text { So }(1+i)^{\mathbf{t}}=(1+\mathbf{i}) \cdot(1+\mathbf{i}) \cdot(1+\mathbf{i}) \cdot(1+\mathbf{i}) \cdot(1+\mathbf{i}) \cdot(1+\mathbf{i}) \cdot(1+\mathbf{i}) \ldots \cdot(1+\mathbf{i}) \text { for " } t \text { " times }
$$

## A. Future Value

Find the value of $\$ 10,000$ in 10 years. The investment earns $5 \%$ per year.

$$
\begin{aligned}
\mathrm{FV}= & \$ 10,000 \cdot(1+\mathrm{i}) \cdot(1+\mathrm{i}) \cdot(1+\mathrm{i}) \cdot(1+\mathrm{i}) \cdot(1+\mathrm{i}) \cdot(1+\mathrm{i}) \cdot(1+\mathrm{i}) \cdot(1+\mathrm{i}) \cdot(1+\mathrm{i}) \cdot(1+\mathrm{i}) \\
\mathrm{FV}= & \$ 10,000 \cdot(1.05) \cdot(1.05) \cdot(1.05) \cdot(1.05) \cdot(1.05) \cdot(1.05) \cdot(1.05) \cdot(1.05) \cdot(1.05) \cdot(1.05) \\
\mathrm{FV}= & \$ 10,000 \mathrm{x}(1.05) \\
& =\$ 10,000 \times 1.62889 \\
& =\$ 16,289
\end{aligned}
$$

Find the value of \$10,000 in 10 years. The investment earns $8 \%$ for four years and then earns $4 \%$ for the remaining six years.

$$
\begin{aligned}
& \text { FV }=\$ 10,000 \cdot(1+\mathrm{i}) \cdot(1+\mathrm{i}) \cdot(1+\mathrm{i}) \cdot(1+\mathrm{i}) \cdot(1+\mathrm{i}) \cdot(1+\mathrm{i}) \cdot(1+\mathrm{i}) \cdot(1+\mathrm{i}) \cdot(1+\mathrm{i}) \cdot(1+\mathrm{i}) \\
& \mathrm{FV}=\$ 10,000 \cdot(1.08) \cdot(1.08) \cdot(1.08) \cdot(1.08) \cdot(1.04) \cdot(1.04) \cdot(1.04) \cdot(1.04) \cdot(1.04) \cdot(1.04) \\
& \mathrm{FV}=\$ 10,000 \mathrm{x}(1.08)^{4} \mathrm{x}(1.04)^{6} \\
& \mathrm{FV}=\$ 17,214.53
\end{aligned}
$$

## B. Present Value:

Same idea, but begin at the end. Rearrange the Future value equation to look like this:

$$
\begin{align*}
& \mathrm{PV}=\mathrm{FV} \div[(1+\mathrm{i}) \cdot(1+\mathrm{i}) \cdot(1+\mathrm{i}) \cdot(1+\mathrm{i}) \cdot(1+\mathrm{i}) \cdot(1+\mathrm{i}) \cdot(1+\mathrm{i}) \cdot(1+\mathrm{i}) \cdot(1+\mathrm{i}) \cdot(1+\mathrm{i})] \\
& \mathrm{PV}=\mathrm{FV} \div(1+\mathrm{i})^{\mathrm{t}} \tag{2}
\end{align*}
$$

Example: How much do I need to invest at $\mathbf{8 \%}$ per year, in order to have $\mathbf{\$ 1 0 , 0 0 0}$ in__
$\qquad$
a. One year: $\quad P V=10,000 \div(1.08)=\$ 9,259.26$
b. Two years: $\quad \mathrm{PV}=\$ 10,000 \div(1.08) \div(1.08)$

OR $\$ 10,000 \div(1.08)^{2}=\$ 8,573$
c. Ten years $\quad P V=\$ 10,000 \div(1.08)^{10}=\$ 10,000 \div 2.1589=\$ 4,632$

## C. Rate of Return

START WITH SAME RELATIONHSIP: $\mathrm{FV}=\mathrm{PV} \mathrm{x}(1+\mathrm{i})^{\mathrm{t}}$
Solve for i.
$(1+i)^{t}=F V / P V$.
$1+\mathrm{i}=(\mathrm{FV} / \mathrm{PV})^{1 / \mathrm{t}}$
$\mathrm{i}=(\mathrm{FV} / \mathrm{PV})^{1 / \mathrm{t}}-1$.
Question: An investor deposits $\$ 10,000$. Ten years later it is worth $\$ 17,910$. What rate of return did the investor earn on the investment?

## Solution:

$$
\begin{aligned}
\$ 17,910 & =\$ 10,000 \times(1+\mathrm{i})^{10} \\
(1+\mathrm{i})^{10} & =\$ 17,910 / 10,000=1.7910 \\
(1+\mathrm{i}) & =(1.7910)^{1 / 10}=1.060 \\
\mathrm{i} & =.060=6.0 \%
\end{aligned}
$$

## D. Finding the Future Value

Find the value of $\$ 10,000$ today at the end of 10 periods at $5 \%$ per period.

## 1. Scientific Calculator:

Use $\left[\mathrm{y}^{\mathrm{x}}\right] \mathrm{y}=(1+\mathrm{i})=1.05$ and $\mathrm{x}=\mathrm{t}=10$.

1. Enter 1.05.
2. Press [ $\mathbf{y}^{\mathrm{x}}$ ].
3. Enter the exponent.
4. Enter [=].
5. Multiply result by $\$ 10,000$.

## 2. Spreadsheet:

|  | A | B |  |
| :--- | :--- | ---: | ---: |
| 1 |  |  |  |
| 2 |  | $5 \%$ |  |
| 3 | Interest Rate | 10,000 | 10 |
| 4 | Present Value | 10 | $16,288.95$ |
| 5 | Periods |  |  |
| 6 | Future Value | $\$$ |  |
| 7 |  | $=\mathrm{B} 4^{*}(1+\mathrm{B} 3)^{\mathrm{B}} \mathrm{B} 5$ |  |
| 8 | Formula in Cell B 6 | $=-\mathrm{FV}(\mathrm{B} 3, \mathrm{~B} 5,0, \mathrm{~B} 4)$ |  |
| 9 | Alternative |  |  |
| 10 |  |  |  |

3. Financial calculator. You may need to input something like this.

Specific functions vary. Be sure to consult the calculator's manual!!!!!!

|  | $\mathrm{n}[\mathrm{N}]$ | $\mathrm{i}[I / \mathrm{YR}]$ | PV | PMT | FV |
| :---: | :---: | :---: | :---: | :---: | :---: |
|  | 10 | 5 | 10,000 | 0 | $?$ |

NOTE: The future value will be negative, indicate an opposite direction of cash flow.

1. Set the calculator frequency to once per period.
2. Enter negative numbers using the $[+/-]$ key, not the subtraction key.
3. Be sure the calculator is set in the END mode.

## E. Fundamental Idea.

Question: What is the value of any financial asset?
Answer: The present value of its expected cash flows.

## F. Finding the Present Value

Find the present value of $\$ 10,000$ to be received at the end of 10 periods at $8 \%$ per period.
a. Scientific Calculator

Scientific Calculator:
Use $\left[y^{x}\right]$ where $y=1.08$ and $x=-1,-2$, or $\mathbf{- 1 0}$.

1. Enter 1.08 .
2. Press [y]
3. Enter the exponent as a negative number
4. Enter [=].
5. Multiply result by $\$ 10,000$.
b. Spreadsheet

|  | A | B |
| :--- | :--- | ---: |
| 1 |  |  |
| 2 |  | $8 \%$ |
| 3 | Interest Rate | 10,000 |
| 4 | Present Value | 10 |
| 5 | Periods | $4,631,93$ |
| 6 | Present Value |  |
| 7 |  |  |
| 8 | Formula in Cell $\mathrm{B6}$ | $=\mathrm{B} 4^{*}(1+\mathrm{B} 3)^{-} \mathrm{B} 5$ |
| 9 | Alternative | $=-\mathrm{PV}(\mathrm{B} 3, \mathrm{~B} 5,0, \mathrm{~B} 4)$ |
| 10 |  |  |

c. Financial calculator. You may need to input something like this.

Specific functions vary. Be sure to consult the calculators' manual!!!!!!

|  | $\mathrm{n}[\mathrm{N}]$ | $\mathrm{i}[\mathrm{I} / \mathrm{YR}]$ | PV | PMT | FV |
| :---: | :---: | :---: | :---: | :---: | :---: |
| c. | 10 | 8 | 10,000 | 0 | $?$ |

The present value will be negative, to indicate the opposite direction of cash flow.

## G. Finding the [geometric average] rate of return:

| $\left.\begin{array}{l}\text { KEY } \\ \text { RELATIONHSIP: } \\ (1+i\end{array}\right)=\mathbf{F V} \div \mathbf{P V}$ |
| :--- |
| $(1+\mathbf{i})=(\mathbf{F V} \div P V)^{1 / t}$ |

## Scientific Calculator

To find $i$, use $\left[y^{x}\right]$ and $[1 / x]$.

1. Enter 1.7910,
2. Press [y $\left.{ }^{x}\right]$
3. Enter the exponent $\mathbf{1 0}$ then press $[1 / \mathbf{x}]$
4. Press [=].
5. Subtract 1
6. Spreadsheet

|  | A | B |
| ---: | :--- | ---: |
| 1 |  | 17,910 |
| 2 | Future Value | 10,000 |
| 3 | Present Value | 10 |
| 4 | Periods | $6.0 \%$ |
| 5 |  | $(\mathrm{~B} 2 / \mathrm{B} 3)^{\wedge}(1 / \mathrm{B} 4)-1$ |
| 6 | Formula in Cell $\mathrm{B} 5=$ |  |

3. Financial Calculator. (Your financial calculator may differ. Consult your manual.)

| $\mathrm{n}[\mathrm{N}]$ | $\mathrm{i}[\mathrm{I} / \mathrm{YR}]$ | PV | PMT | FV |
| :---: | :---: | :---: | :---: | :---: |
| 10 | $?$ | $-10,000$ | 0 | 17,910 |

Answer i = 6\%

- Question: Today your stock is worth $\mathbf{\$ 5 0 , 0 0 0}$. You invested $\$ 5,000$ in the stock 18 years ago. What average annual rate of return [i] did you earn on your investment?

Answer: 13.646\%.

- Question: The total percentage return was $\mathbf{4 5 , 0 0 0} \div \mathbf{5 0 0 0}=\mathbf{9 0 0} \%$. Why doesn't the average rate of return equal $\mathbf{5 0 \%}$, since $\mathbf{9 0 0 \%} \div \mathbf{1 8}=\mathbf{5 0 \%}$ ?

## H. FUTURE VALUE WHEN RATES OF INTEREST CHANGE.

$$
F V=P V \times\left(1+i_{1}\right) \times\left(1+i_{2}\right) \times\left(1+i_{3}\right) \times \ldots \times\left(1+i_{t}\right) .
$$

## Example:

You invest $\$ 10,000$. During the first year the investment earned $20 \%$ for the year. During the second year, you earned only $4 \%$ for that year. How much is your original deposit worth at the end of the two years?

$$
\begin{aligned}
F V & =P V \times\left(1+i_{1}\right) \times\left(1+i_{2}\right) \\
& =\$ 10,000 \times\left(1.20^{`}\right) \times(1.04)=\$ 12,480 .
\end{aligned}
$$

## Question:

The arithmetric average rate of return is $12 \%$, what is the geometric average rate of return?

Answer:
An average rate of return is a geometric average since it is a rate of growth. The $12 \%$ is the arithmetic average. The geometric average rate of return on the investment was $11.7 \%$.

$$
\begin{aligned}
& \mathrm{i} \\
\mathrm{OR} & =(\mathrm{FV} / \mathrm{PV})^{1 / \mathrm{t}}-1=(12,480 / 10000)^{1 / 2}-1=.1171 \\
\mathrm{OR} & =\sqrt{(1.20) \cdot(1.04)}-1=0.1171
\end{aligned}
$$

Important: Although 20\% and 4\% average to $12 \%$, the $\$ 10,000$ not grow by $12 \%$. $\left[\$ 10,000 \times(1.12)^{2}=12,544\right.$ NOT $\left.\$ 12,480\right]$.

## I. COMPOUNDING PERIODS

Up to this point, we have used years as the only time period. Actually, all the previous examples could have been quarters, months, or days.
The interest rate and time period must correspond.

## Example:

## Problem 1.

Find the value of \$10,000 earning 5\% interest per year after two years.
Problem 2.
Find the value of \$10,000 earning 5\% interest per quarter after two quarters.
Both problems have same answer

$$
\$ 10,000 \times(1.05)^{2}=\$ 11,025 .
$$

## However:

In the first problem $t$ refers to years and $i$ refers to interest rate per year. In the second problem $t$ refer to quarters and ito interest rate per quarter.

$$
\begin{aligned}
\mathbf{F V} V_{\mathbf{t}}= & \mathbf{P V} \mathbf{x}(\mathbf{1 + i})^{\mathrm{t}} . \\
& \mathrm{t}=\underline{\text { number of periods }} \\
& \mathrm{i}
\end{aligned}=\underline{\text { interest for the period } .} .
$$

## Alternatively,

$$
\begin{aligned}
& \mathbf{F V _ { \mathbf { t o m } } = P V \times ( 1 + i / m ) ^ { \text { tom } } .} \\
& \mathrm{m}=\text { periods per year, } \\
& \mathrm{t}=\text { number of years, } \\
& \mathrm{i}=\text { the interest per year [APR]. }
\end{aligned}
$$

## Example:

What will $\$ 1,000$ be worth at the end of one year when the annual interest rate is $12 \%$ [This is the APR.] when interest is compounded:

Annually: $\mathbf{t = 1} \mathbf{i = 1 2 \%} \mathrm{FV}_{1}=\operatorname{PV} \times(1+\mathrm{i})^{1}=\$ 1,000 \times(1.12)^{1} \quad=\$ 1,120$.
Quarterly: $\mathbf{t = 4} \quad \mathbf{i}=\mathbf{3 \%} \quad \mathrm{FV}_{4}=\mathrm{PV} \times(1+\mathrm{i})^{4}=\$ 1,000 \times(1.03)^{4} \quad=\$ 1,125.51$.
Monthly: $\mathbf{t = 1 2} \mathbf{i}=\mathbf{1 \%} \quad \mathrm{FV}_{12}=\$ 1,000 \times(1.01)^{12}=\$ 1,000 \times(1.126825)=\$ 1,126.825$.
Daily: $\quad t=\mathbf{3 6 5} \mathbf{i}=(\mathbf{1 2 \%} \div \mathbf{3 6 5})=\mathbf{0 . 0 3 2 8 7 7 \%}$

$$
\mathrm{FV}_{365}=\$ 1,000 \times(1.00032877)^{365}=\$ 1,000 \times(1.12747)=\$ 1,127.47
$$

| $\mathrm{n}[\mathrm{N}]$ | $\mathrm{i}[\mathrm{I} / \mathrm{YR}]$ | PV | PMT | FV |
| :---: | :---: | :---: | :---: | :---: |
| 1 | 12 | 1,000 | 0 | $?$ |
| 4 | 3 | 1,000 | 0 | $?$ |
| 12 | 1 | 1,000 | 0 | $?$ |
| 365 | .032877 | 1,000 | 0 | $?$ |

How about compounding at every instant?
E. CONTINUOUS COMPOUNDING: [Used in Black Scholes option pricing model.]
$\mathrm{t} \cdot \mathrm{m}$
$\lim _{m \rightarrow \infty}\left[1+\frac{i}{m}\right]^{\mathrm{t} \cdot \mathrm{m}}=e^{i t}$
Example: What is $\$ 1,000$ worth in one year if compounded at $12 \%$ continuously.

$$
\begin{aligned}
& \mathrm{FV}=\$ 1,000 \times \mathrm{e}^{.12} \\
& =\$ 1,000 \times 1.127497=\$ 1,127.50
\end{aligned}
$$

This is $\$ .03$ more than daily compounding.
Try this on your calculator. Find the $\mathrm{e}^{\mathrm{x}}$ button. $\mathrm{e}^{.12}=\mathbf{1 . 1 2 7 4 9}$
Present Value Interest Factor $=\left[\mathrm{e}^{-\mathrm{i} t}\right]$
Problem: What is the present value of $\$ 10,000$ to be received 3 years from today compounded continuously at $10 \% ? \mathrm{PV}=\$ 10,000 \mathrm{xe}^{-.10 \times 3}=\$ 10,000 \times 0.74082=\$ 7,408$ Try this on your calculator. Find the $\mathrm{e}^{\mathrm{x}}$ button. $\mathrm{e}^{-0.3}=\mathbf{0 . 7 4 0 8 2}$

## Practice Quiz Questions: PV and FV of a Single sum.

## Review Problems

1. How much must you deposit today in a bank account paying interest compounded quarterly:
a. if you wish to have $\$ 10,000$ at the end of 3 months, if the bank pays $5.0 \%$ APR?

Answer: \$9,877
b. if you wish to have $\$ 50,000$ at the end of 24 months, if the bank pays $8.0 \% \mathrm{APR}$ ?

Answer: \$42,675
c. if you wish to have $\$ 6,000$ at the end of 12 months, if the bank pays $9.0 \%$ APR?

Answer: \$5,489
2. a. What rate of interest [APR] is the bank charging you if you borrow $\$ 77,650$ and must repay $\$ 80,000$ at the end of 2 quarters, if interest is compounded quarterly?

Answer: 6.0\% APR
b. What rate of interest [APR] is the bank charging you if you borrow $\$ 49,000$ and must repay $\$ 50,000$ at the end of 3 months, if interest is compounded monthly?

Answer: $8.0 \%$ APR
3. How much must you deposit today in a bank account paying interest compounded monthly:
a. if you wish to have: $\$ 10,000$ at the end of 1 months, if the bank pays $5.0 \%$ APR ?

Answer: \$9,959
b. if you wish to have: $£ 6,000$ at the end of 6 months, if the bank pays $9.0 \%$ APR ?

Answer: £5,737
c. if you wish to have: $\$ 12,000$ at the end of 12 months, if the bank pays $6.0 \%$ APR ?

Answer: \$11,303
4. If interest is compounded quarterly, how much will you have in a bank account:
a. if you deposit today $£ 8,000$ at the end of 3 months, if the bank pays $5.0 \%$ APR ?

Answer: £8,100
b. if you deposit today $\$ 10,000$ at the end of 6 months, if the bank pays $9.0 \%$ APR ?

Answer: \$10,455
c. if you deposit today $¥ 80,000$ at the end of 12 months, if the bank pays $8.0 \%$ APR ?

Answer: $¥ 86,595$
d. if you deposit today $\$ 5,000$ at the end of 24 months, if the bank pays $5.0 \%$ APR ?

Answer: \$5,522
5. If interest is compounded monthly, how much will you have in a bank account,
a. if you deposit today $£ 8,000$ at the end of 3 months, if the bank pays $5.0 \%$ APR ?

Answer: £8,100
b. if you deposit today $\$ 10,000$ at the end of 6 months, if the bank pays $9.0 \%$ APR ?

Answer: \$10,459
c. if you deposit today $¥ 80,000$ at the end of 12 months, if the bank pays $8.0 \%$ APR ?

Answer: $¥ 86,640$
d. if you deposit today $£ 5,000$ at the end of 24 months, if the bank pays $5.0 \%$ APR ?
6. You borrowed $\$ 1,584$ and must repay $\$ 2,000$ in exactly 4 years from today. Interest is compounded annually.
a. What is the interest rate [APR] of the loan?

Answer 6.0\%
b. What effective annual rate [EAR] are you paying?

Answer 6.0\%
7. You now have $\$ 8,000$ in a bank account in which you made one single deposit $\$ 8,000$ monthly of $\$ 148.97$ exactly 40 years ago. Interest is compounded monthly.
a. What rate of interest [APR] is the bank paying?

Answer 10.0\%
b. What effective annual rate [EAR] is the bank paying?

Answer 10.47\%

## Possibly New Problems.

8. Suppose you make an investment of $\$ 1,000$. This first year the investment returns $12 \%$, the second year it returns $6 \%$, and the third year in returns $8 \%$. How much would this investment be worth, assuming no withdrawals are made?

Answer:
$1000 *(1.12) \times(1.06) \times(1.08)$
$=\$ 1,282$
9. Why is ( $1+\mathrm{i}$ ) called an interest factor?

Factoring the expression $\$ 10,000+10,000 \times i=10,000 \times(1+i)$ Thus ( $1+\mathrm{i}$ ) is an interest factor.
10. Suppose you make an investment of $\$ 1,000$. This first year the investment returns $5 \%$, the second year it returns i. Write an expression, using $i$, that represents the future value of the investment at the end of two years.

Answer:

$$
\mathrm{FV}=1,000 \times(1.05) \times(1+\mathrm{i})
$$

11. An investment is worth $\$ 50,000$ today. This first year the investment returns $9 \%$, the second year it returns i. Write an expression using ithat represents the original value of the investment.

Answer:

$$
\mathrm{PV}=50,000 \div[(1.09) \mathrm{x}(1+\mathrm{i})]
$$

12. Suppose you make an investment of $\$ A$. This first year the investment returns $10 \%$, the second year it returns $16 \%$, and the third year in returns $2 \%$. How much would this investment be worth, assuming no withdrawals are made?

Answer:

$$
\mathrm{A}^{*}(1.10) \times(1.16) \times(1.02)
$$

11. Suppose you make an investment of $\$ 10,000$. This first year the investment returns $15 \%$, the second year it returns $2 \%$, and the third year in returns $10 \%$. How much would this investment be worth at the end of three years, assuming no withdrawals are made?
12. Refer to the above problem. What is the geometric average rate of return?

## Review Fundamentals of Valuation Part II Multiple Periods: Uneven and Even (Annuities)

- Periodic Uneven Cash Flows

What is the value of the following set of cash flows today? The interest rate is $8 \%$ for all cash flows.

$$
\begin{aligned}
& \text { Year and Cash Flow } \\
& \text { 1: \$ } 300 \text { 2: } \$ 500 \quad 3: \$ 700 \quad 4: \$ 1000
\end{aligned}
$$

- Solution: Find Each Present Value and Add

$$
\begin{aligned}
& \frac{300}{1.08^{1}}+\frac{500}{1.08^{2}}+\frac{700}{1.08^{3}}+\frac{1000}{1.08^{4}}= \\
& 277.78 \quad 428.67 \quad 555.68 \quad 735.03=1997.16
\end{aligned}
$$

- Periodic Cash Flow: Even Payments

An annuity is a level series of payments. For example, four annual payments, with the first payment occurring exactly one period in the future is an example of an ordinary annuity.

## A. Present value of an annuity:

The present value of each of the cash flows is the value of the annuity. This could be done one at a time, but this might be tedious.

## Annuity Present Value Interest Factor

$$
\text { PVIFA }=\left[1 /(1+\mathrm{i})+1 /(1+\mathrm{i})^{2}+\ldots+1 /(1+\mathrm{i})^{\mathrm{t}}\right]
$$

$$
\begin{aligned}
& \text { PVIFA }=\sum_{j=1}^{t} 1 /(1+i)^{j} \\
& \text { PVIFA }=\frac{1-1 /(1+i)^{t}}{i}
\end{aligned}
$$

## Example:

What is the present value of a 4-year annuity, if the annual interest is $5 \%$, and the annual payment is $\mathbf{\$ 1 , 0 0 0}$ ?

$$
\mathrm{i}=5 \% ; \mathrm{PMT}=\$ 1,000 ; \mathrm{t}=4 ; \mathrm{PV}=\text { ? }
$$

$$
\mathrm{PV}=1,000 /(1.05)+1,000 /(1.05)^{2}+1,000 /(1.05)^{3}+1,000 /(1.05)^{4} \longleftarrow \text { Long way. }
$$

Factor out the single sum interest rate factors: $\mathrm{PV}=1,000 \times\left[1 /(1.05)+1 /(1.05)^{2}+1 /(1.05)^{3}+1 /(1.05)^{4}\right]=$

$$
\operatorname{PV}=1,000 \times[\operatorname{PVIFA}(4,5 \%)]=\longleftarrow \text { Short Way }
$$

Calculate: $\left.\operatorname{PVIFA}_{(4,5 \%}\right)=\frac{1-1 /(1+\mathrm{i})^{\mathrm{t}}}{\mathrm{i}}=\frac{1-\mathrm{PVIF}_{4.5 \%}}{5 \%} \frac{1-0.8227}{.05}=3.54595$. $\mathrm{PV}=1,000 \times[3.5460]=\$ 3,546$.

## Finding the Future Value of an annuity on a:

1. Scientific Calculator.

To calculate PVIFA using scientific calculator:
FIRST FIND: $\quad \operatorname{PVIF}_{4,5 \%}=1 /(1+\mathrm{i})^{\mathrm{t}}=1 /(1.05)^{4}=0.82270$
THEN FIND: $\quad \operatorname{PVIFA}(4,5 \%)=\frac{1-1 /(1+\mathrm{i})^{\mathrm{t}}}{\mathrm{i}}=\frac{1-\mathrm{PVIF}}{\mathrm{i}} \frac{1-0.8227}{.05}=3.54595$.

$$
=1,000 \times[3.5460]=\$ 3,546
$$

## 2. Using a spreadsheet.

|  | A | B |
| :---: | :---: | :---: |
| 1 |  |  |
| 2 | Rate | 5\% |
| 3 | Payment | -1000 |
| 4 | Periods | 4 |
| 5 | Future Value | 0 |
| 6 | Present Value | \$3,545.95 |
| 7 | Formula in B6 | $=\mathrm{PV}$ ( $\mathrm{B} 2, \mathrm{~B} 4, \mathrm{~B} 3, \mathrm{~B} 5)$ |

3. Using a financial calculator, the Present Value of an annuity.

| $\mathrm{n}[\mathrm{N}]$ | $\mathrm{i}[\mathrm{I} / \mathrm{YR}]$ | PV | PMT | FV |
| :---: | :---: | :---: | :---: | :---: |
| 4 | 5 | $?$ | -1000 | 0 |

Note: Most financial calculators require i [I/YR] to be a percentage. That is enter a 5, not $\mathbf{. 0 5}$. However, Excel requires $\mathbf{0 5}$ or 5\%.

## B. Future value of an annuity:

- Annuity Future Value Interest Factor

$$
\begin{gathered}
\text { FVIFA }=\left[1+(1+\mathrm{i})+(1+\mathrm{i})^{2}+\ldots+(1+\mathrm{i})^{t-1}\right] . \\
F V I F A=\sum_{j=0}^{t-1}(1+i)^{t} \\
F V I F A=\frac{(1+i)^{t}-1}{i}
\end{gathered}
$$

Note: Last Payment earns no interest in ordinary annuity. The interest factor on that payment is 1 . The first payment earns interest for $\mathrm{t}-1$ periods, not t periods.

Example: What is the future value of a 4-year annuity, if the annual interest is $5 \%$, and the annual payment is $\$ 1,000$ ?
$\mathrm{i}=5 \% ;$ PMT $=\$ 1,000 ; \mathrm{t}=\mathbf{4} ; \mathrm{FV}=$ ?

$$
\begin{aligned}
& \$ 1,000 \times\left[1+(1.05)+(1.05)^{2}+(1.05)^{3}\right]= \\
& \$ 1,000 \times[\text { FVIFA }(4,5 \%)]= \\
& \$ 1,000 \times[4.3101]=\$ 4,310.1
\end{aligned}
$$

## Finding FVIFA

## 1. Using scientific calculator:

FIRST FIND: $\quad$ FVIF $=(1+\mathrm{i})^{\mathrm{t}}=(1.05)^{4}=1.2155$
THEN: $\quad$ FVIFA(t,i) $=\frac{(1+\mathrm{i})^{\mathrm{t}}-1}{\mathrm{i}}=\frac{\text { FVIF- } 1}{\mathrm{i}}$

$$
\operatorname{FVIFA}(\mathrm{t}, \mathrm{i})=\frac{\mathrm{FVIF}_{4.5 \%-1}}{5 \%} \frac{1.2155-1}{.05}=4.3101
$$

## 2. Using a Spreadsheet

|  | A | B |
| :---: | :---: | :---: |
| 1 |  |  |
| 2 | Rate | 5\% |
| 3 | Payment | -1000 |
| 4 | Periods | 4 |
| 5 | Present Value | 0 |
| 6 | Future Value | \$4,310.13 |
| 7 | Formula in B6 | =FV(B2, B4, B3, B5 |

3. Using a financial calculator, the Future Value of an annuity:

| $\mathrm{n}[\mathrm{N}]$ | $\mathrm{i}[\mathrm{I} / \mathrm{YR}]$ | PV | PMT | FV |
| :---: | :---: | :---: | :---: | :---: |
| 4 | 5 | 0 | -1000 | $?$ |

FV $=\mathbf{\$ 4 , 3 1 0}$
Question: How much would you need to deposit every month in an account paying 6\% a year to accumulate by $\$ 1,000,000$ by age 65 beginning at age 20 ?

$$
\begin{array}{cl}
\text { Data: } \mathrm{FV}=\$ 1,000,000 & \text { PMT }=? \\
\text { i }=6 \% \div 12=0.5 \% \text { per month } & \\
\mathrm{n}=(65-20) \times 12=45 \times 12=540 \text { months. } &
\end{array}
$$

Answer: PMT $=\$ 362.85$

## C. RATE OF RETURN OF AN ANNUITY

v You borrow $\$ 60,000$ and repay in 8 equal annual installments of $\$ 12,935$ with the first payment made exactly 1 year later. To the nearest percent, what rate of interest are you paying on your loan? Difficult without financial calculator. Can use table to find answer to the nearest percent.

Data:

$$
\overline{i=?} \quad P V=\$ 60,000 \quad \text { PMT }=\$ 12,935 \quad t=8 \text { years }
$$

Relationship: PV = PMT $\times \operatorname{PVIFA}(t, i)$

1. Solution: (Trial and Error with Table)
$\operatorname{PVIFA}(\mathrm{t}, \mathrm{i})=\mathrm{PV} / \mathrm{PMT}=\mathbf{\$ 6 0 , 0 0 0} / 12,935=4.6386$
Table
..... 14\% ....

8 .. 4.6389 ..

Therefore: PVIFA $=$ 4.6386. $\mathrm{S}_{\mathbf{0}}>\mathrm{i}=\mathbf{1 4 \%}$
2. (Trial and Error using a spreadsheet program)

|  | A | B |
| :---: | :---: | :---: |
| 1 |  |  |
| 2 | Periods | 8 |
| 3 | Payment | 12,935 |
| 4 | Present Value | -60,000 |
| 5 | Future Value | 0 |
| 6 | Type | 0 |
| 7 | Guess | 0.1 |
| 8 | Rate | 14.00\% |
| 9 | Formula in Cell B8 | =RATE (B2,B3, B4, B5, B6, B7) |

## 3. (Trial and Error using a financial calculator)

| $\mathrm{n}[\mathrm{N}]$ | $\mathrm{i}[\mathrm{I} / \mathrm{YR}]$ | PV | PMT | FV |
| :---: | :---: | :---: | :---: | :---: |
| 8 | $?$ | 60000 | -12935 | 0 |

## D. Example of Annuity with quarterly compounding:

An investment of $\$ 3000$ per quarter for 6 years at annual interest rate of $8 \%$, compounded quarterly, will accumulate by the end of year 6 to:
Solution:
$\mathrm{FV}=? \mathrm{PMT}=\$ 3,000 \quad \mathrm{t}=24 \mathrm{i}=2 \%$
$\mathrm{FV}=\operatorname{PMT} \times \operatorname{FVIFA}(\mathrm{t}, \mathrm{i})$.
$\mathrm{FV}=\$ 3,000 \times[30.422]=\$ 91,266$.

| $\mathrm{n}[\mathrm{N}]$ | $\mathrm{i}[\mathrm{I} / \mathrm{YR}]$ | PV | PMT | FV |
| :---: | :---: | :---: | :---: | :---: |
| 24 | 2 | 0 | -3000 | $?$ |

## Review Problems with solutions.

1. This one: is a typical mortgage problem. You borrow $\$ 80,000$ to be repaid in equal monthly installments for 30 years. The APR is $9 \%$. What is the monthly payment?

| $\mathrm{PV}=\$ 80,000$ | $\mathrm{i}=0.75 \%$, |
| :--- | :--- |
| $\mathrm{t}=360$ | $\mathrm{PMT}=?$ |

$$
\begin{array}{r}
\$ 80,000=\text { PMT x } 124.282 \\
\text { PMT }=\$ 643.70
\end{array}
$$

| $\mathrm{n}[\mathrm{N}]$ | $\mathrm{i}[\mathrm{I} / \mathrm{YR}]$ | PV | PMT | FV |
| :---: | :---: | :---: | :---: | :---: |
| 360 | .75 | -80000 | $?$ | 0 |

2. Try this one. You make equal $\$ 400$ monthly payments on a loan. The interest rate equals $15 \%$ APR, compounded monthly. The loan is for 12 years. What is the amount of the loan?

Answer: PV = \$26,651
3. Retire with a million: How much would must you deposit monthly in an account paying $6 \%$ a year [APR], compounded monthly, to accumulate $\$ 1,000,000$ by age 65 beginning at age 30 ?

Answer: PMT = \$701.90

| $\mathrm{n}[\mathrm{N}]$ | $\mathrm{i}[\mathrm{I} / \mathrm{YR}]$ | PV | PMT | FV |
| :---: | :---: | :---: | :---: | :---: |
| 420 | 0.50 | 0 | $?$ | 1000000 |

4. Using a financial calculator for annuity calculations:

Calculate the future value of $\$ 60.00$ per year at $7 \%$ per year for eight years.

$$
\begin{aligned}
& F V=60 \sum_{j=o}^{7}(1+.07)^{j} \\
& F V=60 \cdot \frac{(1.07)^{8}-1}{.07} \\
& F V=\$ 615.5
\end{aligned}
$$

| $\mathrm{n}[\mathrm{N}]$ | $\mathrm{i}[\mathrm{I} / \mathrm{YR}]$ | PV | PMT | FV |
| :---: | :---: | :---: | :---: | :---: |
| 8 | 7 | 0 | -60 | $?$ |

$\mathrm{FV}=\$ 615.50$
5. Calculate the future value of $\$ 50.00$ per month at $6 \%$ APR for 24 months

| $\mathrm{n}[\mathrm{N}]$ | $\mathrm{i}[\mathrm{I} / \mathrm{YR}]$ | PV | PMT | FV |
| :---: | :---: | :---: | :---: | :---: |
| 24 | 0.5 | 0 | -50 | $?$ |

FV $=\$ 1,217.60$
6. Calculate the present value of $\$ 500$ per year at $6 \%$ per year for 5 years (monthly compounding).

| $\mathrm{n}[\mathrm{N}]$ | $\mathrm{i}[\mathrm{I} / \mathrm{YR}]$ | PV | PMT | FV |
| :---: | :---: | :---: | :---: | :---: |
| 5 | 6 | $?$ | -500 | 0 |

PV=\$2,106
7. You borrow $\$ \mathbf{5 , 0 0 0}$ and repay the loan with 12 equal monthly payments of $\$ \mathbf{5 0 0}$ ? Calculate the interest rate per month and the APR.

| $\mathrm{n}[\mathrm{N}]$ | $\mathrm{i}[I / \mathrm{YR}]$ | PV | PMT | FV |
| :---: | :---: | :---: | :---: | :---: |
| 12 | $?$ | 5,000 | -500 | 0 |

$\mathrm{i}=2.92 \%$ per month.
APR $=\mathrm{i} \times 12$
$\mathrm{APR}=2.92 \% \times 12=35.04$

## 8. Problem on inflation.

$v$ You will receive $\$ 100,000$ dollars when you retire, forty years from today. If inflation averages $3 \%$ per year for the next forty years, how much would that amount be worth measured in today's dollars? (Note, this is not a time value of money problem, but it solved with a similar calculation. Such adjustments are necessary to overcome "money illusion"]
${ }^{\circ}$ Solution:
$\$ 100,000 \div(1.03)^{40}=100,000 \div 3.26204=\$ 30,655$
D. Annuity Due

| $\mathbf{4 1 , 0 0 0}$ |  |  |  |  |  | $\$ 1,000$ | $\$ 1,000$ | $\$ 1,000$ |  |  |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
| 0 | 1 | 2 | 3 | 4 |  |  |  |  |  |  |

Question: Compare the payments of the annuity due, above, with those of the ordinary annuity earlier. What is the difference? How does this difference affect its value?

Answer: Each payment in an annuity due occurs one period earlier than it would in ordinary annuity. Both present value and future value of each payment in an annuity due if $(1+i)$ times greater than it would be for an ordinary annuity.

Question: What is the present value of the above four-year annuity due?

$$
\begin{array}{ll} 
& \$ 1,000 \times\left[1+1 /(1+\mathrm{i})+1 /(1+\mathrm{i})^{2}+1 /(1+\mathrm{i})^{3}\right] \\
= & \$ 1,000 \times(1+\mathrm{i}) \times\left[1 /(1+\mathrm{i})+1 /(1+\mathrm{i})^{2}+1 /(1+\mathrm{i})^{3}+1 /(1+\mathrm{i})^{4}\right] \\
= & \$ 1,000 \times(1+\mathrm{i}) \times \text { PVIFA } \mathrm{i}_{, 4}
\end{array}
$$

PV interest factor of an annuity due is: (1+i)-PVIFA FV interest factor of an annuity due is: (1+i)-FVIFA

Problem. What is the present value of an annuity due of five $\mathbf{\$ 8 0 0}$ annual payments discounted at $10 \%$ ? $800 \times(1.10) \times$ PVIVA $_{10 \%, 5}=$ $800 \times(1.10) \times 3.79079 \times=$
$800 \times 4.16987=\$ 3,335.9$
Note: Financial calculators have a BEGIN and END mode. The above assumes the END mode. If the calculator is set in the BEGIN mode, it calculates an annuity due.

Problem. What is the present value of an annuity of five annual $\$ 800$ payments discounted at $10 \%$ ? The first payment is due in one-half year from today.

$$
\begin{aligned}
& 800 \times(1.10)^{1 / 2} \times \text { PVIVA }_{10 \%, 5}= \\
& 800 \times(1.04881) \times 3.79079 \times= \\
& 800 \times 3.97581=3,180.7
\end{aligned}
$$
